

Reflection Report

Industry Visit at Kloudtech Corporation

I. Details of the Event/Activity

On May 15, 2025, we conducted an industry visit to Kloudtech Corporation, a promising tech startup located in Balanga City, Bataan, Philippines. Kloudtech is recognized for its innovative work in smart city solutions and climate resilience technologies. The purpose of this visit was to give us a closer look at how the startup was founded and how it operates today.

During the visit, we were welcomed by the company's co-founders and team members. They shared their journey as a startup, their mission for sustainable urban development, and introduced us to several of their ongoing projects. Their dedication to using technology for the betterment of communities was evident throughout the session.

II. Reflections on the Visit (Learnings)

This industry visit gave me a deeper appreciation for how startups can create meaningful impact, especially in local communities. Despite being a relatively small company, Kloudtech's vision and the breadth of their work were both impressive and inspiring.

I learned how technology can be applied beyond commercial gain—such as for disaster preparedness, weather monitoring, and public safety, especially in vulnerable, flood-prone areas. One highlight was understanding how their systems address the limitations of existing weather data in the Philippines. For instance, while agencies like PAGASA provide broad weather data, Kloudtech's localized systems offer community-specific information using strategically placed sensors throughout Bataan, giving residents more accurate and timely updates.

A key insight from the session was the importance of interdisciplinary collaboration. Kloudtech's team is made up of individuals from various fields including software development, data science, environmental studies, and community development. This diversity in expertise allows them to build holistic, user-centered technologies with real-world impact.

III. Reflections on Practical Applications of Learnings

The visit inspired me to view technology not only as a means for innovation and entrepreneurship but also as a tool for social impact and sustainability. Moving forward, I want to consider how the apps or systems I create can address real-world problems especially those affecting underserved communities.

It also encouraged me to integrate user feedback, consider environmental factors, and be more ethically aware when working on future tech projects. I became especially interested in the use of cloud computing, open data, and geospatial technology tools that can support community-driven platforms similar to those being developed at Kloudtech.

This experience sparked my interest in potentially working with startups or social enterprises in the future or even founding one of my own focused on using technology for purposeful and measurable change.

IV. Positive Feedback on the Event Organization

The visit was exceptionally well-organized. The Kloudtech team was welcoming, knowledgeable, and clearly passionate about their mission. Their presentation was engaging and easy to follow, even for students with limited exposure to climate tech or urban planning.

Despite the modest size of their facility, they managed the number of visitors efficiently by splitting us into smaller groups. This allowed for a more personal and interactive experience. They demonstrated live dashboards, real-time sensor maps, and even showed us 3D-printed prototypes of devices currently under development. These hands-on demonstrations made the learning experience both informative and memorable.

V. Suggestions for Future Improvements

At this time, I have no suggestions for improvements. The visit was well-executed, thoughtfully structured, and highly informative. The Kloudtech team provided us with a great learning environment and valuable insights.
