

Reflection Report

Event Title: "International Research Conference on Information Technology Education (IRCITE) 2025"

I. Details of the Event/Activity

The International Research Conference on Information Technology Education (IRCITE) 2025 was held on April 4, 2025, at the Bulacan Capitol Gymnasium, City of Malolos, Bulacan. The conference was hosted by PSITE – Central Luzon and brought together students, educators, and IT professionals for research presentations and knowledge exchange.

Our team presented our capstone project "RESIT" (Recycling Education and Sustainability Information Technology), which focuses on providing gardening tips and promoting barangay-level events centered around the 3R's (Reduce, Reuse, Recycle). The system aims to educate communities about sustainable practices and environmental awareness through accessible technology solutions.

The conference featured various activities including capstone presentations, IT-related talks, cosplay competitions, and ethnic dance performances, creating a balanced mix of academic content and entertainment that kept participants engaged throughout the day.

II. Key Learning Outcomes and Insights

Participating in this research conference provided valuable experience in formal academic presentation and research communication. Although I was not the primary presenter for our RESIT project, observing the presentation process and audience interactions gave me insights into effective research communication and project defense strategies.

The IT talks in the parallel sessions broadened my understanding of current industry trends and technological challenges. These presentations highlighted the importance of research in driving innovation and solving real-world problems, particularly in areas like sustainability and community engagement that our RESIT project addresses.

The diverse range of capstone projects presented showcased innovative approaches to various societal issues, demonstrating how IT solutions can be applied across different domains beyond traditional technology applications.

III. Practical Applications and Implementation

The conference experience enhanced my presentation and communication skills, which are crucial for professional development in the IT industry. The feedback received on our RESIT project provided valuable insights for improving both the technical implementation and user experience aspects of our sustainability-focused system.

The research methodologies and presentation techniques observed will be applicable to future projects and professional situations requiring technical communication and project defense. The emphasis on community-focused IT solutions reinforced the importance of developing technology that addresses real social and environmental needs.

The networking opportunities with other students and professionals provided connections that could support future collaboration on sustainability and technology projects.

IV. Event Organization Assessment

PSITE – Central Luzon demonstrated excellent organizational capabilities in managing this large-scale academic conference. The venue at Bulacan Capitol Gymnasium was appropriate for the number of participants and provided adequate facilities for presentations and activities.

The program balance between formal research presentations and entertaining segments like cosplay and cultural performances was well-executed, maintaining participant engagement while preserving the academic integrity of the event. The efficient program flow and venue management contributed to a productive and memorable experience.

V. Recommendations for Future Events

Networking Sessions: Adding structured networking breaks could help participants connect with peers working on similar research areas or sustainability projects.
